5.2 Continuous random variables

It is often convenient to think of a random variable as having a whole (continuous) interval for its set of possible values.

The devices used to describe continuous probability distributions differ from those that describe discrete probability distributions.

Examples of continuous random variables:

•

5.2.1 Probability density functions and cumulative distribution functions

A *probability density function (pdf)* is the continuous analogue of a discrete random variable's probability mass function (pmf).

Definition 5.12. A probability density function (pdf) for a continuous random variable X is a nonnegative function f(x) with

$$\int_{-\infty}^{\infty} f(x) = 1^{\textcircled{2}}$$

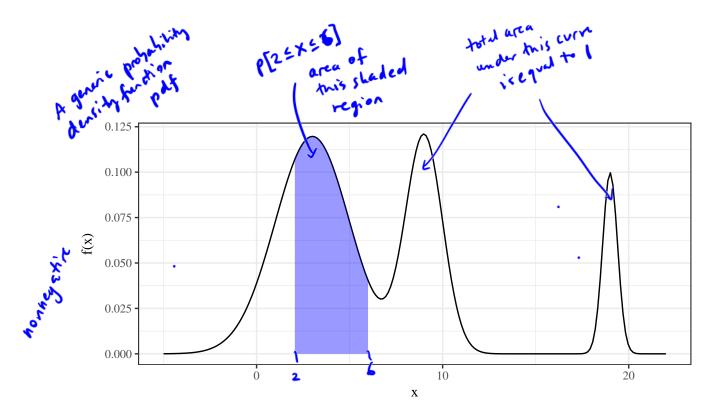

and such that for all $a \leq b$,

$$P[a \le X \le b] = \int_{a}^{b} f(x)dx.$$

1. $f(x) \ge 0$ for all x

2.
$$\int_{a}^{b} f(x) dx = 1$$

3.
$$P[a \le x \le b] = \int_{a}^{b} f(x) dx, \quad a \le b$$

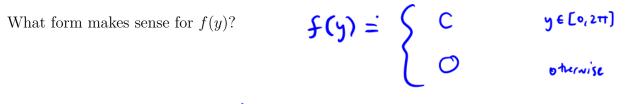

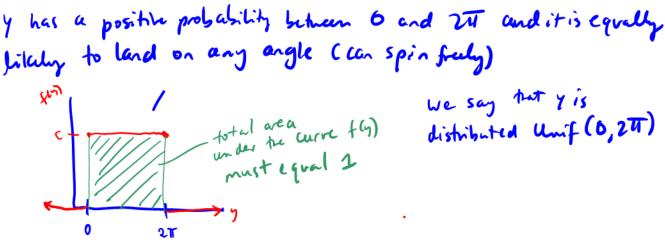

Example 5.17 (Compass needle). Consider a de-magnetized compass needle mounted at its center so that it can spin freely. It is spun clockwise and when it comes to rest the angle, θ , from the vertical, is measured. Let

Y = the angle measured after each spin in radians

What values can Y take? $[o, 2\pi]$

If this form is adopted, that what must the pdf be?

$$1 = \int_{0}^{\infty} f(y) dy = \int_{0}^{0} 0 dy + \int_{0}^{\infty} c dy + \int_{2\pi}^{0} 0 dy$$
$$= cy \Big|_{0}^{2\pi} = 2\pi c$$
$$\Rightarrow c = \frac{1}{2\pi}$$
$$Thus f(y) = \begin{cases} \frac{1}{2\pi} & 0 \le y \le 2\pi \\ 0 & 0 \text{ transe} \end{cases}$$

Using this pdf, calculate the following probabilities:

1.
$$P[Y < \frac{\pi}{2}] = \rho[-\infty < \gamma < \frac{\pi}{2}]$$

$$= \int_{0}^{\pi/2} f(\gamma) d\gamma$$

$$= \int_{0}^{\pi/2} 0 d\gamma + \int_{0}^{\pi/2} \frac{1}{2\pi} d\gamma$$

$$= \frac{1}{2\pi} \cdot \frac{\pi}{2} = \frac{1}{2}$$
2.
$$P[\frac{\pi}{2} < Y < 2\pi] = \int_{0}^{\pi/2} f(\gamma) d\gamma$$

$$= \int_{\pi/2}^{2\pi} \frac{1}{2\pi} d\gamma$$

$$= \frac{1}{2\pi} \cdot 2\pi - \frac{1}{2\pi} \cdot \frac{\pi}{2} = 1 - \frac{1}{2\pi} = \frac{3}{2\pi}$$

3.
$$P[\frac{\pi}{6} < Y < \frac{\pi}{4}] = \int_{\pi/6}^{\pi/4} f(y) dy$$

= $\int_{\pi/6}^{\pi/4} \frac{1}{2\pi} dy$
= $\frac{\pi}{4} \cdot \frac{1}{2\pi} - \frac{\pi}{6} \cdot \frac{1}{2\pi} = \frac{1}{24} \approx .07167$

4.
$$P[Y = \frac{\pi}{6}] = \Pr\left[\frac{\pi}{6} \le \gamma \le \frac{\pi}{6}\right]$$
$$= \int_{T/6}^{T/6} f(y) dy = \int_{T/6}^{T/6} \frac{1}{2\pi} dy$$
$$= \int_{T/6}^{T/6} \left(\frac{\pi}{6} - \frac{\pi}{6}\right) = 0$$

In fact, for any continuous random variable X, and any real number a, P[X=a] = 0. **Definition 5.13.** The *cumulative distribution function* (cdf) of a continuous random variable X is a function F such that

$$F(\mathbf{c}) = P[X \le \mathbf{c}] = \int_{-\infty}^{x} f(t)dt$$

F(x) is obtained from f(x) by integration, and applying the fundamental theorem of calculus yields

$$\frac{d}{dx}F(x) = f(x).$$

•

That is, f(x) is obtained from F(x) by differentiation.

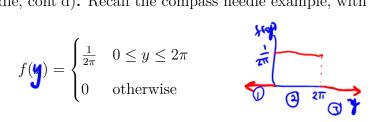

As with discrete random variables, F has the following properties:

1. F(x) 20 for all real xc.

٠

3.
$$\lim_{x \to \infty} F(x) = 0$$
 and $\lim_{x \to \infty} F(x) = 1$.

Example 5.18 (Compass needle, cont'd). Recall the compass needle example, with

Find the cdf.

For
$$y < 0$$

 $F(y) = P[Y \le y] = \int_{-\infty}^{y} f(t) dt = \int_{-\infty}^{y} 0 dt = 0$

For $0 \le y \le 2\pi$

$$F(y) = P[Y \le y] = \int f(t) dt + \int -f(t) dt$$

= $\int 0 dt + \int \frac{1}{2\pi} dt = \frac{1}{2\pi}$.

For $y > 2\pi$

$$F(y) = P(Y \leq y) = \int_{0}^{z} f(t) dt + \int_{0}^{2\pi} F(t) dt + \int_{0}^{2\pi} f(t) dt$$

$$\int_{-\infty}^{z} f(t) dt \longrightarrow = \int_{-\infty}^{z} \frac{0}{2\pi} dt + \int_{0}^{2\pi} \frac{1}{2\pi} dt + \int_{2\pi}^{2\pi} \frac{0}{2\pi} dt$$

$$= 2\pi \cdot \frac{1}{2\pi} = 1$$

$$\int_{0}^{2\pi} \frac{1}{2\pi} = 1$$

$$\int_{0}^{2\pi} \frac{1}{2\pi} = 1$$

$$\int_{0}^{2\pi} \frac{1}{2\pi} = 1$$

Calculate the following using the cdf:

$$F(1.5) = F(1.5) = \frac{1.5}{2\pi} = \frac{3}{4\pi} \approx 6.2387$$

$$P[Y \le \frac{1}{2}] = F(\frac{1\pi}{5}) = \frac{4\pi/5}{2\pi} = \frac{2}{5} = 0.4$$

$$I = P(X > X) + P(Y \le X)$$

$$P(X \text{ is on the number large } = 1$$

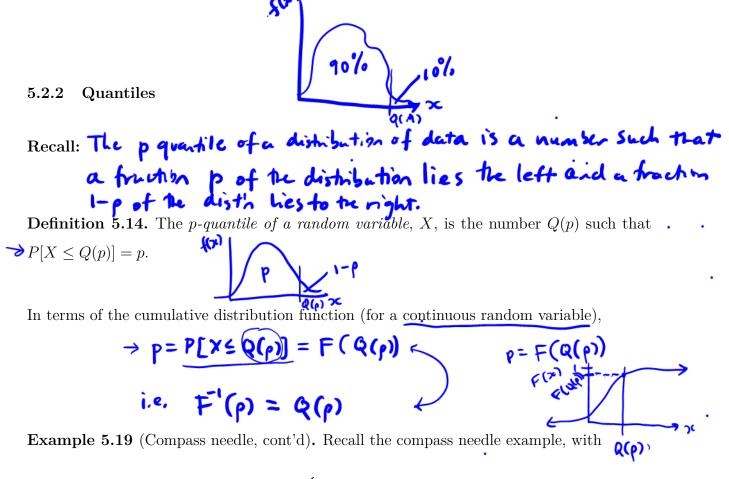

$$= P(X > X \text{ or } X \le X) + P(X \le X)$$

$$= P(X > X) + P(X = X)$$

$$= P(X > X) + P(X = X)$$

$$= P(X > X) + P(X = X)$$

$$= P(X$$

$$f(x) = \begin{cases} \frac{1}{2\pi} & 0 \le y \le 2\pi \\ 0 & \text{otherwise} \end{cases}$$

Q(.95):

$$0.95 = P(Y \le Q(.95))$$

= $\int_{0}^{Q(.95)} \int_{0}^{Q(.95)} \int_{0}^{1} \int_{0}^{0} \int_{0}^{0}$

On average, 95% of the readle spins will be below 5.9690 radians.

You can also calculate quantiles directly from the cdf.

$$F(\mathbf{y}) = \begin{cases} 0 & y < 0\\ \frac{1}{2\pi}y & 0 \le y \le 2\pi\\ 1 & \text{otherwise} \end{cases}$$

Q(.25):

$$0.25 = P[Y \le Q(.25)]$$

$$= F(Q(.25)) = \frac{Q(.25)}{2\pi}$$

$$\Rightarrow Q(.25) = .25 \cdot 2\pi = \frac{\pi}{2} \approx 1.5708 \text{ radians}$$

$$\uparrow$$

$$Q(.5)$$

$$Q_{(.5)}$$
 0.5 = $P[Y \le Q(.5)] = F(Q(.5)) = \frac{Q(.5)}{2\pi}$

 \Rightarrow Q(.5) = .5.2T = TT \approx 3.1416 radians.

•

Means and variances for continuous distributions 5.2.3

It is possible to summarize continuous probability distributions using

1. plot of probability density function f(x) [Kind of idenlited probability histogram]

So EX~ Zxf(x)dx

2. mean (mensure of location)

flor)

407

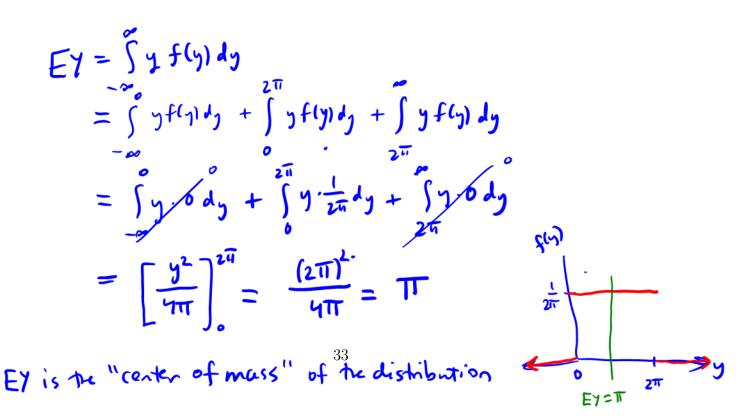

3. Variance (measure of sprend)

Definition 5.15. The *mean* or *expected value* of a continuous random variable X is reasoning: the probability in a small inter around x is approximately f(x)dx.

Sometimes $\longrightarrow EX = \int_{-\infty}^{\infty} xf(x)dx.$

Example 5.20 (Compass needle, cont'd). Calculate EY where Y is the angle from vertical in radians that a spun needle lands on.

$$f(y) = \begin{cases} \frac{1}{2\pi} & 0 \le y \le 2\pi \\ 0 & \text{otherwise} \end{cases}$$

Example 5.21. Calculate EX where X follows the following distribution

$$f(x) = \begin{cases} 0 & x < 0 \\ \frac{1}{3}e^{-x/3} & x \ge 0 \end{cases}$$

$$E \chi = \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= -xe^{-x/3} \int_{0}^{\infty} + 0 \int_{0}^{\infty} x f(x) dx$$

$$= -xe^{-x/3} \int_{0}^{\infty} + 0 \int_{0}^{\infty} e^{-x/3} dx$$

$$= -xe^{-x/3} \int_{0}^{\infty} + 0 \int_{0}^{\infty} e^{-x/3} dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

$$= \int_{0}^{\infty} x f(x) dx + \int_{0}^{\infty} x f(x) dx$$

Definition 5.16. The *variance* of a continuous random variable X is

$$\operatorname{Var} X = \int_{-\infty}^{\infty} (x - \mathrm{E}X)^2 f(x) dx = \int_{-\infty}^{\infty} x^2 f(x) dx - (\mathrm{E}X)^2.$$

intion of X is $\sqrt{\operatorname{Var} X}$.

•

The standard deviation of X is $\sqrt{\operatorname{Var}X}$.

Example 5.22 (Library books). Let X denote the amount of time for which a book on 2-hour hold reserve at a college library is checked out by a randomly selected student and suppose its density function is

$$f(x) = \begin{cases} 0.5x & 0 \le x \le 2\\ 0 & \text{otherwise} \end{cases}$$

•

•

•

Calculate EX and VarX.

$$Ex = \int x f(x) dx$$

= $\int x f(x) dx + \int x c f(x) dx + \int x c f(x) dx$
= $\int x c dx + \int x c f(x) dx + \int x dx + \int x dx + \int x dx$
= $\int c dx + \int x c dx + \int x dx + \int x dx$
= $\int c dx + \int x c dx$
= $\int c dx + \int x c dx$

$$(Ex)^{2} \downarrow E(x^{2}) = \int_{0}^{\pi} x^{2} f(x) dx$$

= $\int_{0}^{\pi} x^{2} 0.5 x dx$
= $0.5 \frac{x^{4}}{4} \Big|_{0}^{2} = \frac{16}{8} = 2$
 $\Rightarrow Var X = E(x^{2}) - (Ex)^{2} = 2 - (\frac{8}{6})^{2} = \frac{2}{9}$

Example 5.23 (Ecology). An ecologist wishes to mark off a circular sampling region having radius 10m. However, the radius of the resulting region is actually a random variable R with pdf

$$f(r) = \begin{cases} \frac{3}{2}(10-r)^2 & 9 \le r \le 11\\ 0 & \text{otherwise} \end{cases}$$

Calculate ER and SD(R).

$$ER = \int r f(r) dr$$

$$= \int_{1}^{n} r \cdot \frac{3}{2} (10 - r)^{2} dr$$

$$= \frac{3}{2} \int_{1}^{n} (100r - 20r^{2} + r^{3}) dr$$

$$= \frac{3}{2} \left[100 \frac{r^{2}}{2} - 20 \frac{r^{3}}{3} + \frac{r^{4}}{7} \right]_{1}^{n}$$

$$= \frac{3}{2} \left[100 \frac{11^{2}}{2} - 20 \frac{11^{3}}{3} + \frac{11^{4}}{7} - 100 \frac{7^{2}}{2} + 20 \frac{7^{3}}{3} - \frac{7^{4}}{7} \right]$$

$$= 10$$

$$E(R^{3}) = \int r^{2} f(r) dr$$

$$= \int_{1}^{n} r^{2} \frac{3}{2} (10 - r)^{2} dr$$

$$= \frac{3}{2} \int_{1}^{n} 100 r^{2} - 20r^{3} + r^{4} dr$$

$$= \frac{3}{2} \left[\frac{100r^{3}}{3} - 20r^{4} + \frac{r^{5}}{5} \right]_{1}^{n} = 100.6$$

$$VarR = E(R^{4}) - (ER)^{2} = 100.6 - 10^{2} = 0.6$$

$$SD(R) = \sqrt{VarR} = \sqrt{0.6} \approx 0.77476$$

Why does
$$E(X^2) = \int_{-\infty}^{\infty} x^2 f(x) dx$$
?
For any function g of a rendom variable X_j
 $E(g(X)) = \int_{-\infty}^{\infty} g(x) f(x) dx$ when $f(x)$ is the pdf of X
 $-\infty$.

So,
$$EX^2 = \int x^2 f(x) dx$$
 where $g(x) = X^2$

Example 5.24 (Ecology, cont'd). Calculate the expected area of the circular sampling

region. R= the radius of the circular sampling region A = the area of the circular sampling region

$$= TTR^{4}$$

$$EA = ETTR^{2} = \int_{-\infty}^{\infty} TTr^{2} f(r) dr \quad \text{where } g(R) = TTR^{2}, \text{ the sample area}$$

$$= TT \int_{-\infty}^{\infty} r^{2} f(r) dr$$

 $= \pi . 100.6$

•

For a linear function, $g(\mathbf{x}) = a\mathbf{x} + b$, where a and b are constants,

$$E(aX+b) = \int (ax+b) f(x) dx$$

= $\int axf(x) dx + \int bf(x) dx$
= $a \int xf(x) dx + b \int f(x) dx$
EX

= a EX + 6

$$Var(a X + b) = E [(a X + b)^{2}] - [E(a X + b)]^{2}$$

$$= E [a^{2} X^{2} + 2ab X + b^{2}] - [a E X + b]^{2}$$

$$= \int_{a}^{b} (a^{2} x^{2} + 2ab x + b^{2}) f(x) dx - (a^{2} [E X]^{2} + 2ab E X + b^{2})$$

$$= a^{2} E (X^{2}) + 2ab E X + b^{2} - (a^{2} (E X)^{2} + 2ab E X + b^{2})$$

$$= a^{2} E (X^{2}) - a^{2} (E X)^{2}$$

$$= a^{2} E (X^{2}) - a^{2} (E X)^{2}$$

$$= a^{2} [E(X^{2}) - a^{2} (E X)^{2}]$$

$$= a^{2} [E(X^{2}) - (E X)^{2}]$$

Example 5.25 (Ecology, cont'd). Calculate the expected value and variance of the *diameter* of the circular sampling region. D = diameter of circular sampling. region

$$= 2 \cdot R$$

$$g(R) = \frac{2}{a} \cdot R + 0$$

$$ED = Eg(R) = E[2 \cdot R + 0] = 2ER + 0 = 20$$

Var D = Var (g(R)) = Var (2 \cdot R + 0) = 2² Var R = 4 \cdot .6 = 2.4

•

Definition 5.17. Standardization is the process of transforming a random variable, X, into the signed number of standard deviations by which it is above its mean value.

•

•

$$Z = \frac{X - EX}{SD(X)}$$
 subtracting the mean and dividuly by the s.d.

.

•

 ${\cal Z}$ has mean 0

$$EZ = E\left[\frac{X - EX}{SO(X)}\right]$$
$$= E\left[\frac{1}{SD(X)}X - \frac{EX}{SD(X)}\right]$$
$$= \frac{1}{SD(X)}EX - \frac{EX}{SD(X)}$$
$$= 0$$

 ${\cal Z}$ has variance (and standard deviation) 1

$$\begin{aligned} \forall u_r \ \vec{z} &= \ \forall u_r \left(\frac{\mathbf{x} - \mathbf{E}\mathbf{x}}{\mathbf{SO}(\mathbf{x})} \right) \\ &= \ \forall u_r \left(\frac{1}{\mathbf{SO}(\mathbf{x})} \right)^{\mathbf{X}} \left(\frac{\mathbf{E}\mathbf{x}}{\mathbf{SO}(\mathbf{x})} \right) \\ &= \left(\frac{1}{\mathbf{SD}(\mathbf{x})} \right)^{\mathbf{2}} \ \forall u_r \mathbf{x} = 1 \end{aligned}$$

A special continuous distribution 5.2.4

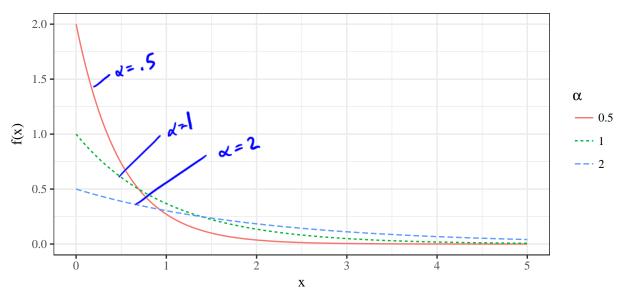

Just as there are a number of useful discrete distributions commonly applied to engineering problems, there are a number of standard continuous probability distributions.

1 parameter **Definition 5.18.** The exponential(α) distribution is a continuous probability distribution with probability density function

example 5.21
is an Exp(3)
rondom visible
$$f(x) = \begin{cases} \frac{1}{\alpha}e^{-x/\alpha} & x > 0\\ 0 & \text{otherwise} \end{cases}$$

for $\alpha > 0$.

Examples:

An $\text{Exp}(\alpha)$ random variable measures the waiting time until a specific event that has an This is kind of like a continuous version of the geometric USA. equal chance of happening at any point in time.

- Time between your writed at the bus stop and the moment your bus ance. - Time until vext person walks inside the library - Time until the next car accident on a statch of highway

It is straightforward to show for $X \sim \operatorname{Exp}(\alpha)$,

1.
$$\mu = \mathbf{E}X = \int_{0}^{\infty} x \frac{1}{\alpha} e^{-x/\alpha} dx = \mathbf{A}$$

2. $\sigma^{2} = \mathbf{Var}X = \int_{0}^{\infty} (x-\alpha)^{2} \frac{1}{\alpha} e^{-x/\alpha} dx = \mathbf{A}^{2}$

•

4

Further, F(x) has a simple formulation:

For
$$\Im(\langle o \rangle)$$
:

$$F(x) = P(X \leq x)$$

$$= \int_{-\infty}^{\infty} f(f) df$$

$$= \int_{-\infty}^{\infty} 0 dt = 0$$

For XZO:

$$F(x) = P(x \le x)$$

$$= \int_{0}^{x} f(t) dt$$

$$= \int_{0}^{0} dt + \int_{0}^{x} \frac{1}{x} e^{t/x} dt$$

$$= \left[-\frac{e^{t/x}}{e^{t/x}} \right]_{0}^{x}$$

$$= -\frac{e^{-x/x}}{e^{-x/x}} + 1 = 1 - \frac{e^{-x/x}}{e^{-x/x}}$$

$$\Rightarrow$$
 Fbx) = $\left\{1 - e^{-x/x} \times z_{41}^{20}\right\}$

Example 5.26 (Library arrivals, cont'd). Recall the example the arrival rate of students at Parks library between 12:00 and 12:10pm early in the week to be about 12.5 students per minute. That translates to a 1/12.5 = .08 minute average waiting time between student arrivals.

Consider observing the entrance to Parks library at exactly noon next Tuesday and define the random variable

T = the waiting time (min) <u>until</u> the first student passes through the door.

Using $T \sim \text{Exp}(.08)$, what is the probability of waiting more than 10 seconds (1/6 min) for the first arrival? $P(\top > \frac{1}{6}) = I - P(\top \leq \frac{1}{6})$ fer) =1-F(士) 10 $= | - (| - e^{-\frac{1}{6} \cdot \frac{1}{100}})$. 12 5 × 70 (11: F(N)=1-ex)d What is the probability of waiting less than 5 seconds? 5 seconds = 12 minute [[*] $P(T < \frac{1}{12}) = F(\frac{1}{12}) = (1 - e^{\frac{1}{12} \cdot \frac{1}{10}}) \approx .6471$ 10 1 (f(x)dx 5 Note: since T is continuous, P(T=c) = 0 for all c. Meaning, $P(T < c) = P(T \le c)_2 = F(c)$. 1.1

The Normal distribution 5.2.5

We have already seen the normal distribution as a "bell shaped" distribution, but we can 2 parameter formalize this.

Definition 5.19. The normal or Gaussian(μ, σ^2) distribution is a continuous probability distribution with probability density

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2} \quad \text{for all } x$$

for σ > 0. and m E R (literally any real number)

A normal random variable is (often) a finite average of many repeated, independent, identical trials.

It is not obvious, but

$$1. \int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2} dx = 1$$

2.
$$EX = \int_{-\infty}^{\infty} x \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2} dx = \mu$$

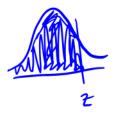

are actually the mean and variance
of the distribution.
3.
$$VarX = \int_{-\infty}^{\infty} (x-\mu)^2 \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2} dx = 0^2$$

The Calculus I methods of evaluating integrals via anti-differentiation will fail when it comes to normal densities. They do not have anti-derivatives that are expressible in terms of elementary functions.

What to do? Computer or use tables of values.

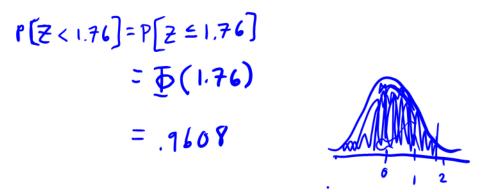

The use of tables for evaluating normal probabilities depends on the following relationship. If "change of variable" $Z = \frac{\chi - \mu}{C}$ $X \sim \text{Normal}(\mu, \sigma^2),$ $P[a \le X \le b] = \int_{\sigma}^{\sigma} \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2} dx = \int_{\sigma}^{\sigma} \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{x^2}{2}/2} dz = P\left[\frac{a-\mu}{\sigma} \le Z \le \frac{b-\mu}{\sigma}\right]$ $P[a \leq X \leq b] = P[a-n \leq X-n \leq b-n]$ where $Z \sim \text{Normal}(0, 1)$. X" Normal (milling) $P(a \le X \le b)$ = p[<u>a-n</u> < <u>X-n</u> < <u>b-n</u>] $= P[\frac{a-m}{c} \leq Z \leq \frac{b-m}{c}]$ b m+6 M M+26 0 M-26 equal area Fullorent (o'l) <u>≤ <u>b-/</u>^m)</u> 2 **Definition 5.20.** The normal distribution with $\mu = 0$ and $\sigma = 1$ is called the *standard*

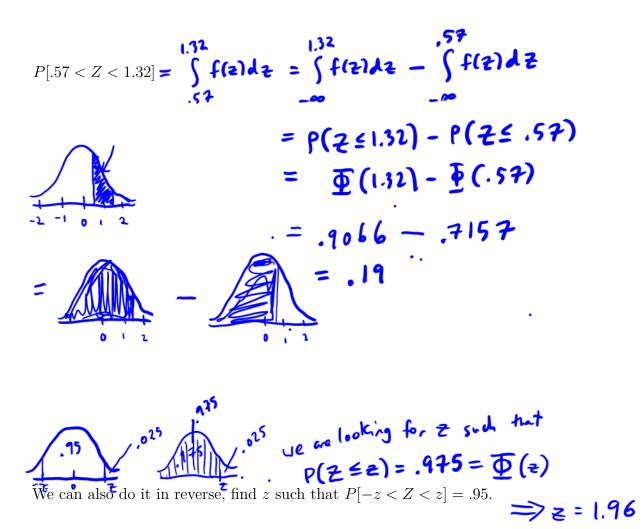

Denotion distribution. Denotion about probabilities why Normal (u, 6^t) -> OTransform to a question about N(0,1) -> O look up in tables. So, we can find probabilities for all normal distributions by tabulating probabilities for only the standard normal distribution. We will use a table of the standard normal cumulative probability function.

$$\Phi(z) = F(z) = \int_{-\infty}^{z} \frac{1}{\sqrt{2\pi}} e^{-t^2} dt. = \Pr\left[\sum \in \mathcal{F}\right]$$

Example 5.27 (Standard normal probabilities). P[Z < 1.76]

Example 5.28 (Baby food). J. Fisher, in his article Computer Assisted Net Weight Control (*Quality Progress*, June 1983), discusses the filling of food containers with strained plums and tapioca by weight. The mean of the values portrayed is about 137.2g, the standard deviation is about 1.6g, and data look bell-shaped. Let

W = the next fill weight.

And let W~N(137.2, 1.62)

Let's find the probability that the next jar contains less food by mass than it's supposed to (declared weight = 135.05g).

$$P(W < 135.05) = P(\frac{W - 1.37.2}{1.6} < \frac{135.05 - 137.2}{1.6})$$

= $P(Z < -1.34)$
= $\overline{\Phi}(-1.34)$
= .0901
So there is about a 9% choice the next jor contains less
food by main than it is support to.

Table B.3

Standard Normal Cumulative Probabilities

-1.2	.1151	.1131	.1112	.1093	1075	.1056	.1038	.1020	.1003	.0985

	Example 5.29 (More normal probabilities). Using the standard normal table, calculate the following: $P(X \le 3), X \sim \text{Normal}(2, 64)$ $P(X \le 3) = P(\frac{X-1}{8} \le \frac{3-2}{8})$ $= P(\frac{Z} \le 0.125)$ $e \overline{\Phi}(0.125)$ $P(0.125)$ $Conservative = 0.5478$
	$P(X > 7), X \sim \text{Normal}(6,9)$ $P(X > 7), X \sim \text{Normal}(6,9)$ $P(X > 7) = P(\frac{x-6}{3} > \frac{7-6}{3})$ $= P(\frac{z}{2} > .3333)$ $= P(\frac{z}{2} > .34)$ $= [-P(\frac{z}{2} < .34)]$ $= [-P(\frac{z}{2} < .34)]$ $= [-\frac{1}{2}(.34)]$
Z~N(0,1)	$ = \rho(X-1>0.5 \text{ er} X-1<5) $ $ = \rho(X-1>0.5) \pm \rho(X-1<5) $ $ = \rho(X>1.5) + \rho(X<0.5) $ $ = \rho(X-2>1.5-2) + \rho(X-2<0.5-2) $

We can find standard normal quantiles by using the standard normal table in reverse.

Example 5.30 (Baby food, cont'd). For the jar weights $X \sim \text{Normal}(137.2, 1.62^2)$, find $0, | = P(X \leq Q(0, I))$ Q(0.1).2 2 2

$$= P\left(\frac{X-137.2}{1.62} \le \frac{Q(0.1)-137.2}{1.62}\right) = \Phi\left(\frac{Q(0.1)-137.2}{1.62}\right)$$

$$\Rightarrow \Phi^{-1}(0.1) = \frac{Q(0.1)-137.2}{1.62} \Rightarrow 1.62 \Phi^{-1}(0.1) + 137.2 = Q(0.1)$$

$$\Phi^{-1}(0.1) \approx -1.28 \quad \text{probability of } \neq \le -1.28 \text{ is } a \pm 1 \text{ east } 0.1^{''}$$

Table B.3 $\Rightarrow Q(0.1) \approx 1.62 (-1.28) + 137.2 = 135.152$

Example 5.31 (Normal quantiles). Find:

$$Q(0.95) \text{ of } X \sim \text{Normal}(9,3) \quad (\overline{5})^{5} = 3$$

$$0.95 = P(X \le Q(.95))$$

$$= P(X \le Q(.95) = 9$$

$$= P(Z \le Q(.95) = 9)$$

$$= \overline{P}(Z \le Q(.95) = 9)$$

$$= \overline{P}(\frac{Q(.95) - 9}{\sqrt{3}})$$

$$= \overline{P}(\frac{Q(.95) - 9}{\sqrt{3}})$$

$$= \overline{P}(\frac{Q(.95) - 9}{\sqrt{3}} \implies \sqrt{3} \overline{P}(0.95) + 9 = Q(.95)$$

$$Q(.95) \approx \sqrt{3} (1.65) + 9$$

$$= (1.557 + 89)$$

$$c \text{ such that } P(|X - 2| > c) = 0.01, X \sim \text{Normal}(2, 4)$$

$$\cdot 0 | = P(|X - 2| > c) = 0.01, X \sim \text{Normal}(2, 4)$$

$$\cdot 0 | = P(|X - 2| > c) = 0.01, X \sim \text{Normal}(2, 4)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= P(X - 2 > c) + P(|X - 2| < c)$$

$$= \rho(x-2>c) + \rho(x-2<-c)$$

$$= \rho(x-2>c) + \rho(x-2<-c)$$

$$= \rho(\frac{x-2}{2}>\frac{c+2-2}{2}) + \rho(\frac{x-2}{2}<\frac{2-c-2}{2})$$

$$= \rho(\frac{x-2}{2}>\frac{c+2-2}{2}) + \rho(\frac{x-2}{2}<\frac{2-c-2}{2})$$

$$= \rho(\frac{x-2}{2}>\frac{c}{2}) + \rho(\frac{x-2}{2}<\frac{2-c-2}{2})$$

$$= \rho(\frac{x-2}{2}>\frac{c}{2}) + \rho(\frac{x-2}{2}<\frac{-c}{2})$$

$$= \rho(\frac{x-2}{2}>\frac{c}{2}) + \rho(\frac{x-2}{2}<\frac{-c}{2})$$

$$= \rho(\frac{x-2}{2}>\frac{c}{2}) + \rho(\frac{x-2}{2}<\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}>\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$

$$= \rho(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2}) = 2\overline{\rho}(\frac{-c}{2})$$
